Haven't We Seen This Before?
Sustaining a Vision in Teacher Education
for Progressive Teaching Practice

By Shelley C. Sherman

Efforts to transform U.S. schools and improve student learning, including both accountability measures and progressive practices, come in cycles and are often related to contextual factors in society at particular moments in time (Cuban, 1993; Noddings, 2007; Zilversmit, 1999). Attempts to improve education during the past forty years under the banner of "educational reform" have included political initiatives generated externally by those who do not work within schools, as well as pedagogical trends and movements conceived and implemented by educators themselves. Moreover, such endeavors often gain rapid support and, subsequently, lose traction as bandwagon movements often do, reinventing themselves years later packaged somewhat differently.

A variety of such initiatives have affected the way curriculum in schools is shaped and how teachers teach. For example, the standards movement has provided the impetus for a one-size-fits-all curriculum (see, for example, Meier & Wood,

Shelley C. Sherman is an associate professor and chair of the Education Department at Lake Forest College, Lake Forest, Illinois.

2004, Noddings, 2007), with uniform benchmarks for achievement for students at particular grade levels. On the other hand, the open education movement of the late 1960s and early 1970s promoted responsiveness to students and aimed to meet students' individual needs (Perrone, 1972; Silberman, 1973).

The central issue I will address here concerns the challenge to teacher education programs to resist

- Popular but poorly conceived or implemented innovations, are rarely sustained.
- Bandwagons and fads.
- The key to effective *sustainable* innovation is evidence of success.

Did they fail?

- Social resistance
- Political resistance
- No evidence supporting open learning successes

John Hattie tops Australia

The AFR Magazine's hotly anticipated list includes lists of the key players across various sectors. Here, the top five from education

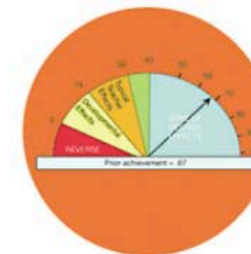

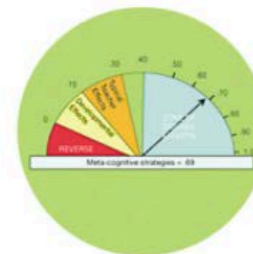

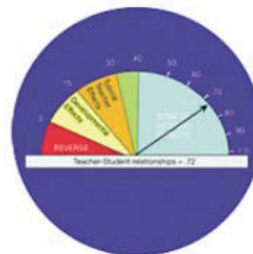

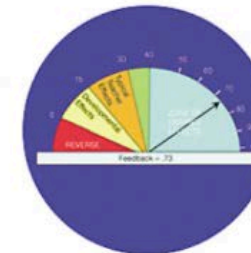

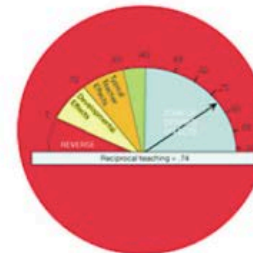

John Hattie's research as an education professor at the University of Cambridge is helping to decide which are the best, most cost-effective ways of improving schools.

Power is in flux in education after the failure of the Labor's Gonski school funding plan.

VISIBLE LEARNING

A SYNTHESIS OF OVER 800 META-ANALYSES RELATING TO ACHIEVEMENT

The Hattie Edict...

“Open classrooms make little difference to student learning outcomes”. (p. 88)

Unpacking the Hattie Edict...

1. Quality of the data was questionable.

- Failed to define key concepts.
- Avoided longitudinal studies.
- Frequently used inadequate sample sizes (Gray, 1978).
- Measurement instruments favoured traditional classrooms (Doob, 1974).
- ‘...not all studies can be considered [methodologically] equal’ (Marshall, 1981, p. 82).

Unpacking the Hattie Edict...

1. Quality of the data was questionable.
2. Age of the data is an issue.
 - All four meta analyses conducted between 1980 and 1982 on studies conducted in the 1970s.
 - “...a finding of ‘no effect’ in the 1970s cannot be used to plausibly claim a similar trend exists in the 2010s’ (Imms, Cleveland & Fisher, 2016, p. 28).

Unpacking the Hattie Edict...

1. Quality of the data was questionable.
2. Age of the data is an issue.
3. Inconsistent stipulative definitions.
 - Open programs versus open classrooms?
 - ‘Open versus traditional’ programs ranged widely in actual practice (McPartland & Epstein, 1978).
 - Many ‘open programs’ frequently were taught in traditional classrooms.

Unpacking the Hattie Edict...

1. Quality of the data was questionable.
2. Age of the data is an issue.
3. Inconsistent stipulative definitions.
4. Omitted all qualitative data.

Factor	Studies	Findings
Student achievement	7	Two significant findings favourable of open programs in primary schools, one statistically insignificant finding. High school studies found one favourable of open programs, two statistically insignificant. Researchers cautioned that the measurement tools favoured students in 'traditional' settings.
Student self-concept	3	One study found students in open programs had higher measures of self-esteem. Two studies produced statistically insignificant findings. Boys' self-esteem was significantly higher in open programs.
Student behaviour	3	Open programs produced higher levels of student academic confidence, greater intellectual independence, better use of time, fewer incidents of disruptive behaviour.
Student attitude	5	Four studies found statistically significant findings on student attitude favourable to open programs, one study the reverse. Boys' attitudes to learning were improved in open programs.
Transition (OP to traditional)	1	Students from a primary school open program found transition to high school easier than traditional program peers.
Teacher opinion and morale	6	Of two high school studies of teacher opinion and morale, one was in favour of open programs, one the opposite. Of primary teachers, one found morale lower in open programs. A study of inexperienced teachers was favourable to open programs. Teachers in small, informal open program 'teaching teams' were more satisfied than colleagues in large teams. No one personality 'type' suited open program teaching.
Parent and community reaction	4	Three studies were favourable to open programs, one showed no significant result. A 'community and police opinion' study was in favour of open programs.
Administration roles	2	One study found a need to free Principals from administration in order to focus on in-service training and leadership.
School costs	1	Open program schools allowed for increased enrolment capacity, a more diversified program, and increased floor space for instructional use.

From Educational Research Services (1974). *Research on open education*.

The Hattie Edict...

“Open classrooms make little difference to student learning outcomes”. (p. 88)

Five most misused words in research...

“There is no evidence that...”

*“There’s no existing evidence that space impacts student learning...but it must, surely? So lets find that evidence.”
(Hattie 2011, personal correspondence).*

THE blackboard has already gone from most NSW classrooms. Now, the head of a big school system is determined that the classroom itself joins it in the scrapbook of history.

"It's dead," said Greg Whitby, the executive director of 78 schools in the Catholic diocese of Parramatta, which 42,000 students attend.

He is not alone. The Sydney diocese has embarked on the same path for primary schools. Forty of the 112 primary schools already use large-form learning areas instead of classrooms and the diocese is keen to expand their use.

New dividing walls separate classes in open-space rooms at Laverton P-12 College. Photo: Jason South

They knocked down walls to revolutionise learning and now they are putting them up again.

Open-plan classrooms have caused nothing but trouble for many schools, which are putting up partitions and walls to counter the deafening noise created in the barn-like spaces.

Otago primary principals have been left scratching their heads after the Ministry of Education committed funding to a new education partnership with Australia that aims to explore how innovative learning environments can enhance teaching.

The trans-tasman education partnership, titled the Innovative Learning Environments and Teacher Change Project, was announced by New Zealand Education Minister Hekia Parata earlier this week.

It involves the ministry and at least six New Zealand schools participating in the four-year project, led by the University of Melbourne's Learning Environments Applied Research Network.

The project leadership team includes Prof John Hattie, a former Auckland University education professor and current director of the Melbourne Education Research Institute.

What are our problems?

- Resistance, scepticism, poor spatial awareness.
- Poor teacher involvement in conceptualisation of designs.
- Vision + design of spaces are outstripping teachers' capacity to use them.
- Need for **good evidence** to support change.

A profile of future curricular needs

Subject, teacher, date: Design & Technology, Max, May 7th 2013.

School educational philosophy, underpinning future practices (from SSEI Survey)

- **Aim:** Facilitate individual students' potential through developing personal skills and knowledge, independence, capacity for personalised learning, producing skills/capacities that society requires.
- **Strategy:** Creative and technological skills development; developing cognitive capacity (higher order thinking, meta-cognitive skills)
- **Method:** Specialised instruction; flexible curriculum; personalised learning approach; collaborative teaching, collaborative learning.
- **Particular foci:** Active learning; practice-based pedagogies; flexible, creative, non-prescriptive pedagogies.

Logistics	Now	15 Years
How many students do your subject?	About 800 - 850	This number is unsustainable in the current and planned facilities. But increased advances and widespread access to specialist Computer aided IT in our teaching will allow for less centralised instruction, thus less demand on physical learning spaces based around full-sized classes.
Why do students do your subject?	It does not feel like school. Getting success through creating something.	Same as currently, but 'doing' D/T will not look like it does now, spatially. D/T facilities will look more like a Technological library, open spaces, with specialised 'nooks'. The subject will appeal to students who can imagine a solution (and then act on making that solution happen), rather than seek to follow prescribed patterns of working. Discovery learning rather than repetition of previous skills.
What are the career implications for students doing your subject?	Vocational.	D/T students will be those who seek careers where they use imagination to create solutions. The graduate will be one who is a creator/manufacturer, rather than a consumer of existing ideas and practices. He will be working in industries that seek to create something that is not yet imagined, produce, market and reap the rewards of being producers.
What are the social implications of students doing your subject?	At the moment, there is a tendency towards social interactions not always work related. There is in the current set up of the spaces, quite a bit of interaction between boys (and vertically between year groups as well) as boys move from room to room seeking specialised equipment.	In the future, D/T will be more 'cognitive'. With the subject more focused on imagination and idea generation, quieter spaces (the 'library' effect) will be more common, thus less movement and socialisation. But group work/brainstorming will be prevalent. Group master classes, breaking out into homogeneous projects with students from all age groups represented in project teams.
Groupings	Now	15 Years
What natural 'groupings' (teacher) occur as part of using this space?	Teachers tend to work independently due to space restrictions/organisation of equipment. There is collaboration in planning, assessment etc., but little in the way of teaching.	Groups of students will be taught by groups of teachers. Each teacher will teach to their speciality, and not organised around classes of boys, but to a group of students. Teachers will

Textual analysis.

Bernhard Huber Text Analysis of the primary data indicates 'students' (2.9%), 'space' (2.2%), 'design' (1.5%), 'equipment' (1.1%), 'timetable' (1%), and 'specialisation' (1%) to be the six most used terms in the data. The first three logically reflect the focus of this instrument. The latter group draws attention to leading teachers' interest in three key facets of future Hayward-Midson curriculum: equipment (as opposed to materials), timetabling and specialisation of tasks and spaces.

Word	Occurrences	Frequency	Rank
students	50	2.9%	1
spaces	37	2.2%	2
design	25	1.5%	3
equipment	19	1.1%	4
timetable	18	1%	5
specialist	18	1%	5
future	16	0.9%	6
skills	15	0.9%	6
teachers	15	0.9%	6

Table 1: Text frequency analysis (Bernhard Huber)

Lexalytics Salience Sentiment Text Analysis was conducted on primary data specific to leading teachers' beliefs of present and future Hayward-Midson curriculum. Comments relevant to the *present curriculum* provided a +108 document sentiment. Topics and themes relevant to the present situation are summarised in Table 2.

Themes

	Evidence	Sentiment
commercial arts industries	7	+4.15
restrictive room design	7	-3.33
open studio sessions	7	+0.31
computer game design	7	+2.58
discipline-specific study approach	7	+1.77
specific age groups	7	+1.96
future careers	7	+4.15
creative occupations	7	+4.15
graphic design	7	+4.15
product design	7	+4.15

Topics

	Score
Education	0.82

EVALUATING 21ST CENTURY
LEARNING ENVIRONMENTS

2013–2016
ARC Linkage
Project

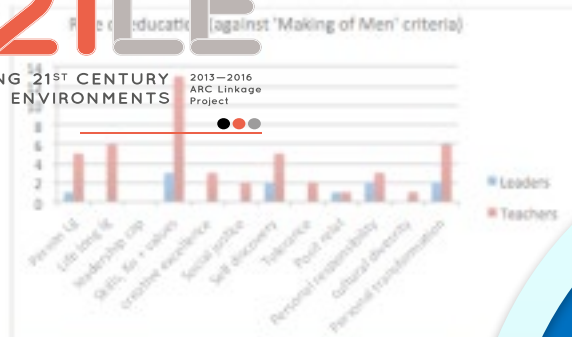

Figure 2: Q4 distribution of responses analysed using 'making of men' criteria

Figure 2 illustrates an unequal frequency and distribution of Making of Men criteria. The school's vision for learning to be heavily biased towards the acquiring of development of personal skills. The 'civics' tenets within the school's vision are a visible focus. This trend was, in the main, very similar to the content analysis while the 'leader' and 'teacher' groups placed emphasis in differing areas. This was required when suggesting any inter-group variability.

Question 5 asked participants what they believed students should learn in two stages, a content analysis, and a cross-sample thematic analysis (summarised in Table 3, below).

Table 3: Q5 sample of responses, 'what students should learn': all groups

Codes	Responses - Q5 Beliefs about what students should learn
Learning as a rewarding pursuit (15)	To learn that knowledge is a desirable commodity. To learn how to learn. To learn how to discover.
Resilience, persistence (5)	A degree of self-motivation is needed. Skills for resilience. Interest in life for all they are worth. Resilience, adaptability.
Knowledge (21)	A certain body of facts needs to be acquired. Schools should teach for resilience. (Required) literacies and essential information for personal, traditional academic pursuits. Students should be learning (academic) numerate. Students learn how to learn. Subject specific content to meet a range of thinking skills and subject knowledge. The 'teacher' ... focus on the education, formal and technical skills, academic knowledge, scholarly habits. To good (14).
Personal and social skills (6)	Schools should actively teach social skills. Respect for themselves, family, teachers and the community. How to work with others and communicate appropriately. (Develop) skills to work effectively and efficiently independently and within a group.
Questioning, reasoning (8)	How to ask questions and then to know how to answer them. Learning how to learn. They should be exposed to multi-variant ways of thinking. Problem solving, higher order thinking. Content often but always in context. The ability to learn and think but also to absorb content with a critical and open mind.
Life long learning (2)	How to prepare for more individual learning. Independent, life long learners.
Creativity, problem solving (8)	(Skills) to make them creative problem solvers of the future. The need for creativity to be fostered. An emphasis on developing problem-solving strategies in real-life situations.

Downloaded from the University of Melbourne Library on 20/08/2016. See the University of Melbourne Library website for more information.

- The 'four tenets' were consistently viewed as constituting the definitive statement of the school's core beliefs about education, being cited as such in 35% of responses; in most cases no further elaboration was made. This suggests success by the school to embed knowledge of its vision for learning amongst its staff.
- 'Academic' was - understandable - the main focus of respondents' understanding regarding the stated beliefs of the school's educational focus. However, in terms of actual practices (column 2), skills and knowledge received surprisingly little reference, while 'personal responsibility' and 'personal transformation' were discussed considerably more than was done in the 'stated beliefs' part of this item. Respondents articulated educational beliefs that were more complex than those summarised in the 'Making of Men' criteria, particularly when discussing qualities of education that were affective or meta-cognitive in nature.

The degree to which participants felt the twelve 'Making of Men' criteria were being addressed in current practices. Q10 focused on the degree to which current practices addressed the criteria, and is illustrated in the polar graphs in Figures 4 and 5 (leader group).

Figure 4: Q10 distribution of responses (teacher group)

Figure 5: Q10 distribution of responses (leader group)

Noise level descriptors

Each 'dot' represents the L_{eq} over a 15 minute period]

The L_{eq} is defined as where the graph area is the same above the line as below the line, and is often referred to as the Average.

L_{A90} The noise level exceeded for 90% of the measurement period, measured in dBA. This is commonly referred to as the background noise level.

L_{Amax} The A-weighted maximum noise level. The highest noise level which occurs during the measurement period. [in the context of a school, this could be a loud squeal near the microphone, or someone dropping something – it is unlikely to be teacher voice]

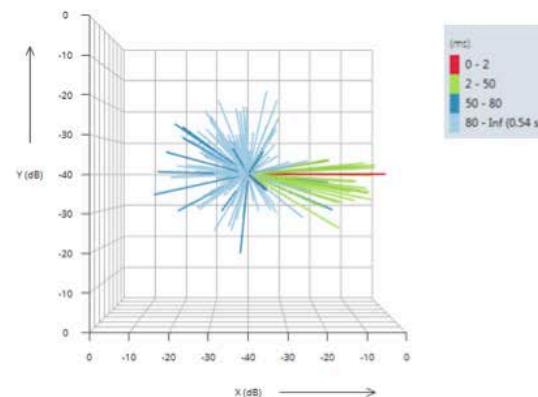

$L_{Aeq}(t)$ The equivalent continuous (time-averaged) A-weighted sound level. This is commonly referred to as the "average" noise level.

The suffix "t" represents the time period to which the noise level relates, e.g. (8 h) would represent a period of 8 hours, (15 min) would represent a period of 15 minutes and (2200-0700) would represent a measurement time between 10 pm and 7 am.

Sound varies over time. The L_{eq} is effectively defined as a notional steady sound level, which over a stated period of time, would contain the same amount of acoustical energy as the actual, fluctuating sound measured over that period (in our case 15 mins).

Table 5: Learning 4 Receiver 3

EVALUATING 21ST CENTURY
LEARNING ENVIRONMENTS 2013–2016
ARC Linkage
Project

		Meeting the <i>needs</i> of those who wish...			
		To describe	To classify	To identify causality	To determine value
The purpose of evaluation research is...	(Aim)				
	(Through)				
	To improve	Formative analysis (judgment)			
	To audit	Summative analysis (appraisal)			
	To generate theory	Predictive analysis (analysis)

Innovative Learning Environments and Teacher Change (Australian Research Council)

- 4 years
 - Australia and New Zealand
 - 15 Partner Organisations (State Education Departments, research-oriented schools, industry partners)
 - 6 PhDs, 3 Research Fellows
 - Sample pool of 6100 schools
-

Phase 1

Are teachers using ILEs? What is being done well, what needs addressing?

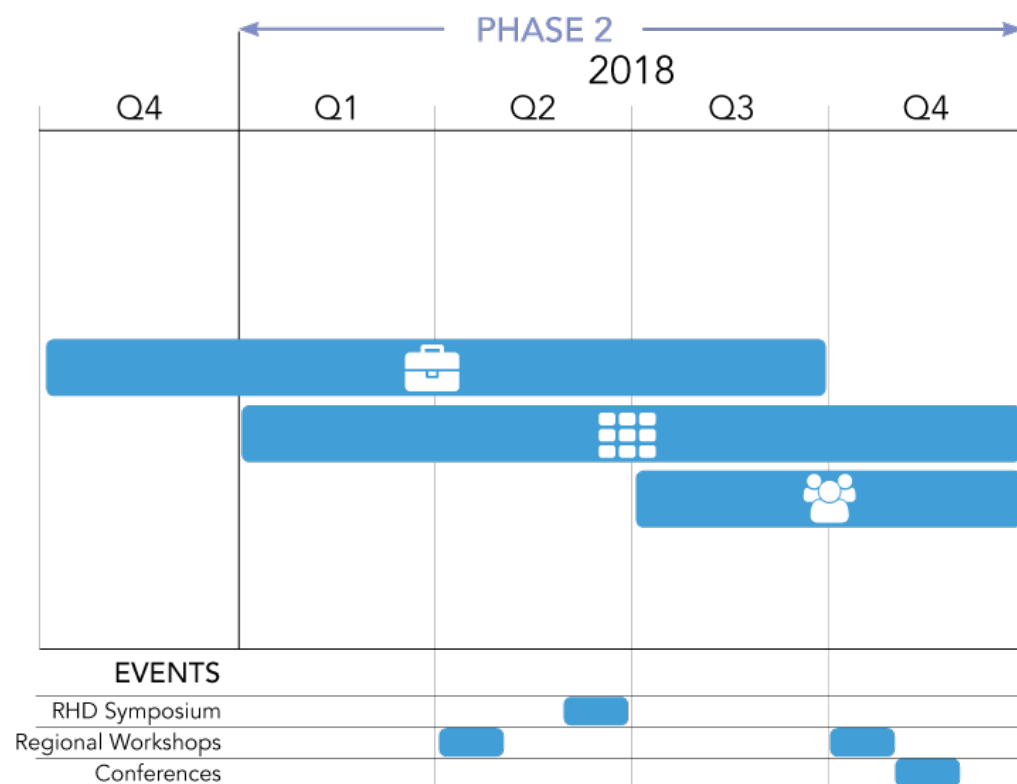

- Assumption testing
- Baseline data on core variables
- Measurement tool development and trial

Phase 2

What strategies are needed? Are they 'workable'?

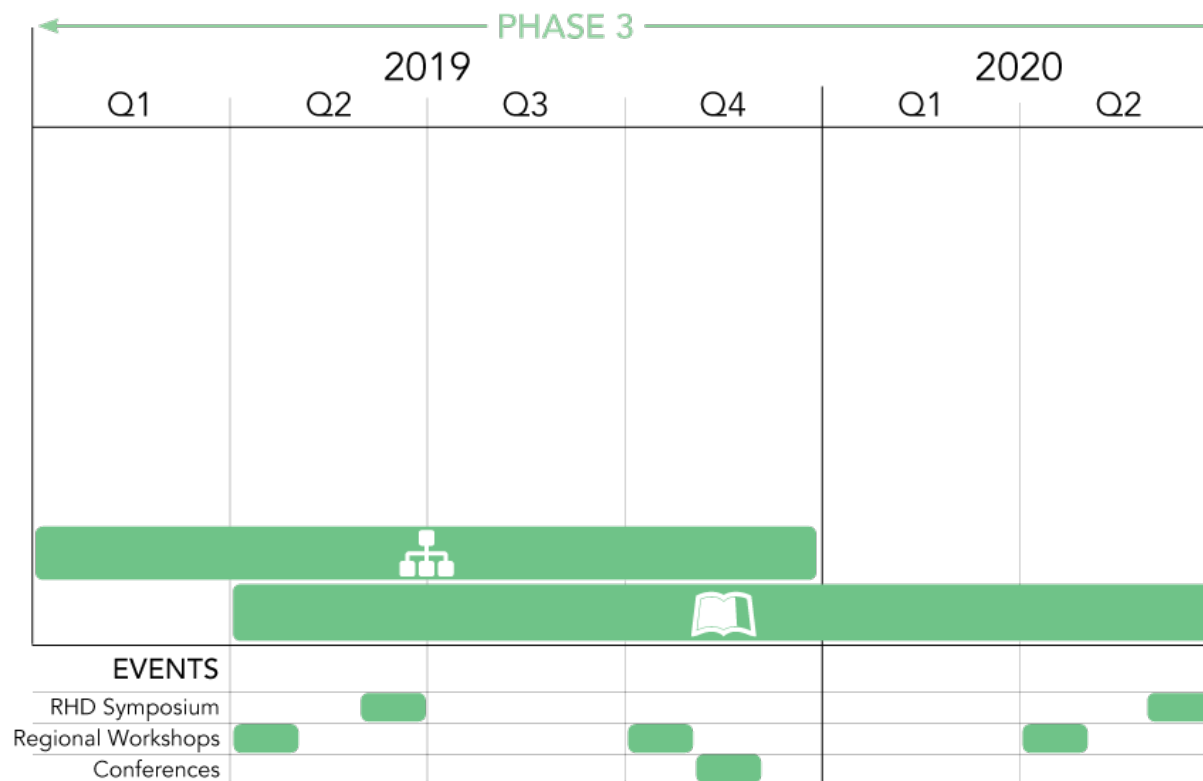

- Development of strategies to assist teachers utilise ILEs
- Trial of strategies

Phase 3

Do these strategies work? Is student deep learning improved?

- Quasi-experimental testing of strategies across 1000 schools

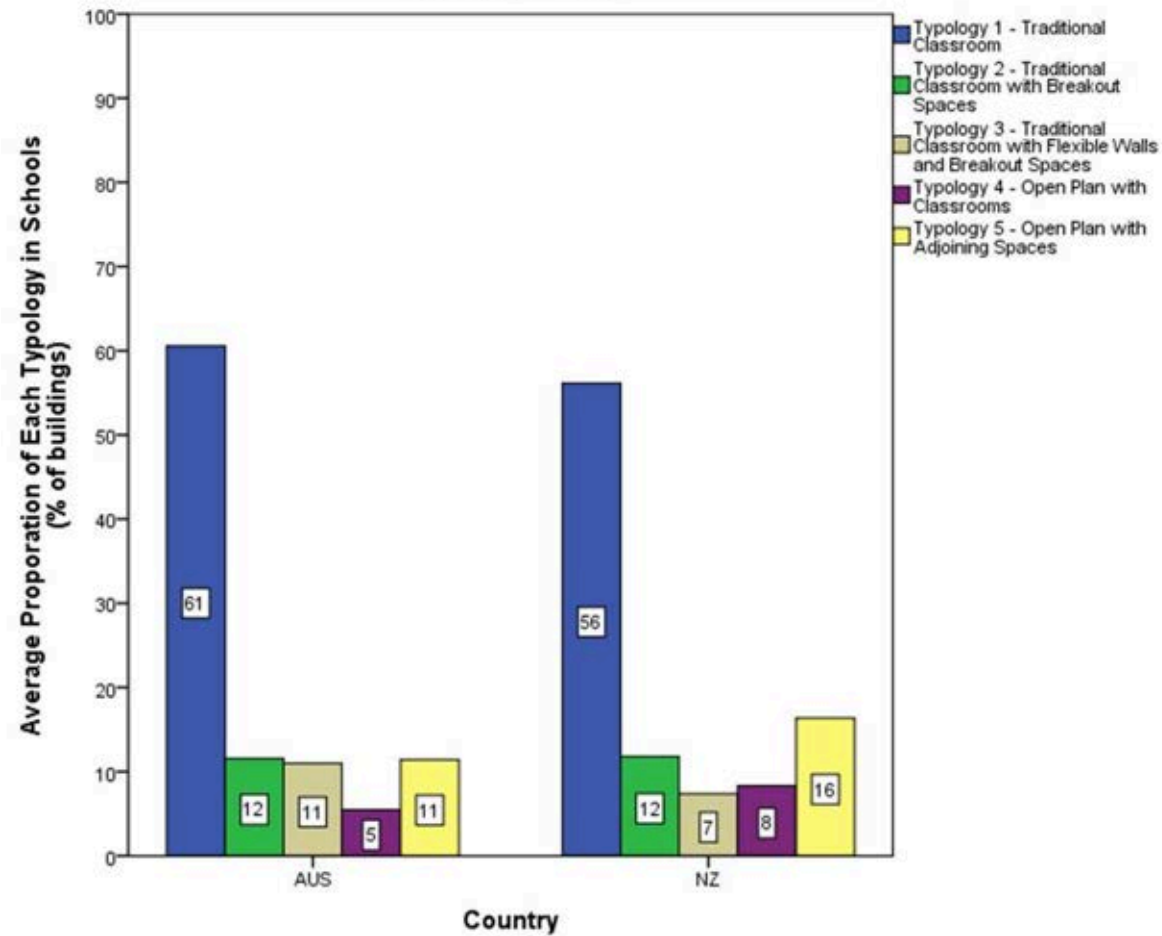

ILETC Stage 1, Phase 1 Survey

- Three clusters of questions;
 - What types of ILEs and what % of the total school infrastructure?
 - Principal perceptions of the type of teaching that is happening in most predominant classroom type?
 - Principal perceptions of degree of student ‘deep learning’ happening in most predominant classroom type?
- 14% response rate (822 schools)*

ILETC Stage 1, Phase 1 Survey

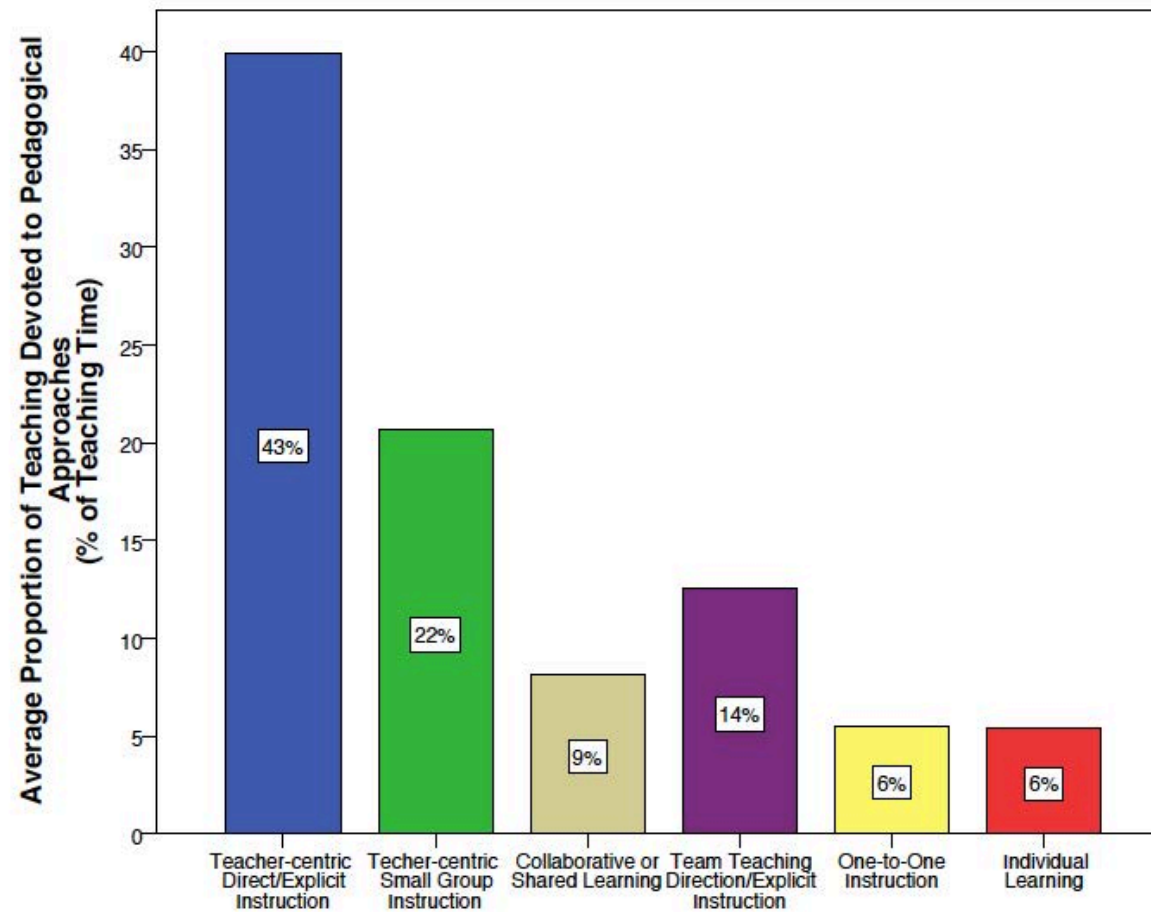

Types of Physical Learning Spaces in Australian and New Zealand Schools (n = 822)

ILETC Stage 1, Phase 1 Survey

Types of Pedagogies in Australian and New Zealand Schools (n = 822)

Summary

- Australian and New Zealand school design is arguably outstripping teachers' capacity to use them well.

Summary

- Australian and New Zealand school design is arguably outstripping teachers' capacity to use them well.
- Teachers are resisting change – mind frames.

Summary

- Australian and New Zealand school design is arguably outstripping teachers' capacity to use them well.
- Teachers are resisting change – mind frames.
- In this field there is a history of poor collection and use of evidence.

Summary

- In Australia and New Zealand, school design is arguably outstripping teachers' capacity to use them well.
 - Teachers are resisting change – mind frames.
 - In this field there is a history of poor collection and use of evidence.
 - The critical focus must be **gathering and using evidence to assist teachers align pedagogies with innovative learning space design.**
